

Schedule

Explanation:

This schedule represents the dependencies of all the tasks completed in this sprint. We began with database insertion so that we could build the backend endpoints and be able to test them properly. Unit and automated testing have been implemented this sprint but have a weak dependency on backend/frontend code. From there, the question cards and question pages were built accordingly to POST/GET from the backend endpoints alongside some static component-based info pages. Once finished, we connected the front and back end to create the final product. Some extra features, including logout functionality, adjusting colours and spaced repetition, were added along the way.
